Superstore Sales Dashboard using Power BI

Problem Statement

Management wants to quickly understand sales performance across products, categories, and regions. Create appropriate Power BI visualizations to identify key business patterns.

Note: The Sample Superstore dataset was specifically used for this analysis, sourced from Kaggle.

Introduction

Power BI makes it easy to turn plain sales data into charts and numbers that are simple to read. In this project, the Sample Superstore dataset is used to build one dashboard page that shows total sales, profit, and orders, and lets the user filter this data by region, category, segment, and date.

Methodology / Steps Followed

Step 1: Data Collection

- Downloaded the Sample Superstore dataset from Kaggle, as given in the assignment.
- The dataset has order-level sales records with fields such as Order ID, Order Date, Customer ID, Region, Category, Sub-Category, Product Name, Sales, Quantity, Discount, and Profit.

Step 2: Importing Data into Power BI

- Opened Power BI Desktop and loaded the dataset using the Get Data option.
- The dataset was loaded as a single table named "Sample_ Superstore".
- Checked the Data pane to confirm all columns were loaded correctly.

Fig 1: Sample_Superstore fields in the Power BI Data pane

Step 3: Creating DAX Measures

The following DAX measures were created to use across the dashboard:

- Total Sales
- Total Quantity
- Total Profit
- Total Orders
- Profit Margin
- Product Sales

```
1 Total Sales = SUM('Sample_ Superstore'[Sales])
```

```
1 Total Quantity = SUM('Sample_ Superstore'[Quantity])
```

```
1 Total Profit = SUM('Sample_ Superstore'[Profit])
```

```
1 Total Orders = DISTINCTCOUNT('Sample_ Superstore'[Order ID])
```

```
1 Profit Margin = DIVIDE([Total Profit], [Total Sales], 0)
```

```
1 Product Sales = [Total Sales]
```

Fig 2: DAX measures used in the dashboard

Step 4: Building the Dashboard

- Built a single dashboard page titled "Superstore Sales Dashboard".
- Added KPI cards for Total Sales, Total Profit, Total Orders, and Profit Margin.
- Added a column chart for Total Sales by Category.
- Added an area chart for Sum of Sales by Day.
- Added a column chart for Sum of Profit by Category.
- Added a bar chart for Total Sales by Region.
- Added a scatter chart comparing Sum of Sales and Sum of Profit by Sub-Category.
- Added a bar chart for Total Sales by Sub-Category.
- Added a bar chart for Total Sales by Product Name.

Step 5: Adding Filters

- Added filter options for Region, Category, and Segment.
- Added a date range slider for Order Date.
- These filters let the user view sales data for a chosen region, category, customer type, or time period.

Step 6: Final Dashboard

The completed Superstore Sales Dashboard is shown below.

Fig 3: Superstore Sales Dashboard

The dashboard shows total sales, profit, orders, and margin on one page, along with charts and filters for region, category, segment, and time period.

Conclusion

This project used the Sample Superstore dataset to build a single-page Power BI dashboard. DAX measures such as Total Sales, Total Profit, Total Orders, and Profit Margin were created to track business performance. Charts, KPI cards, and filters were added so that sales and profit could be viewed by region, category, segment, and product. The dashboard makes it easier to understand overall business performance at a glance.

Learning Outcomes

Through this project, I learned:

1. How to import a dataset into Power BI using Get Data.
2. How to write basic DAX measures using SUM, DISTINCTCOUNT, and DIVIDE.
3. How to build KPI cards and different types of charts in Power BI.
4. How to add filters and slicers to make a dashboard interactive.
5. How to design a single-page dashboard for business reporting.
6. How to read sales and profit data to find useful business patterns.
